

Mobile Sale Dashboard

1. Project Overview

This Power BI project is a Mobile Sales Dashboard designed to analyse sales performance across brands, mobile models, cities, payment methods, and time periods from 2021 to 2023.

The main objective is to help stakeholders understand sales trends, customer behaviour, and regional performance for better decision-making.

2. Data Model Explanation

Tables Used:

Fact Table – Sales_Data

- Transaction ID
- Brand & Mobile Model
- Units Sold & Price per Unit
- Customer, City, Payment Method
- Customer Rating (numeric & categorical)
- Date & Day Name

This is fact table containing transactional-level sales data.

Dimension Table – Custome_Calendar

- Date
- Day Name

I created a custom calendar table to enable time intelligence like MTD and Same Period Last Year analysis.

Calculated Table – Top5CitiesBasedOnTotalSales

This calculated table dynamically identifies the **top 5 cities based on total sales**, improving performance and simplifying visuals.

keyword: **Star Schema, Fact & Dimension tables**

3. Filters / Slicers (Show Interactivity)

Explain slicers before visuals.

Added slicers for **Mobile Model**, **Brand**, and **Payment Method** so users can dynamically slice the dashboard and analyze specific segments.

4. Dashboard Pages

PAGE 1: MAIN DASHBOARD (Mobile Sales Overview)

This is main executive dashboard, which gives a high-level overview of mobile sales performance across cities, brands, models, payment methods, and time.

◇ Top KPI Cards

1. Total Sales – 769M

This KPI shows the overall revenue generated from mobile sales between 2021 and 2023.

2. Total Quantity – 19K

This represents the total number of mobile units sold, helping distinguish between high-value vs high-volume sales.

3. Transactions – 4K

This shows the number of completed sales transactions, useful to analyze customer purchase frequency.

4. Average Price – 40K

This KPI highlights the average selling price per transaction, indicating product positioning and customer spending behavior.

◇ Filters / Slicers

Added slicers for Mobile Model, Brand, and Payment Method, allowing stakeholders to dynamically analyze specific segments.

◇ Visuals Explanation (This is the heart)

Total Sales by City (Map)

This map visual shows the geographical distribution of sales, clearly highlighting top-performing cities like Delhi, Mumbai, and Bangalore.

Insight: Metro cities contribute the majority of revenue.

Total Quantity by Month (Line Chart)

This chart tracks monthly sales quantity, helping identify trends and seasonality across the year.

Insight: Sales peak in certain months, indicating seasonal demand.

Rating by Rating Status (Funnel)

Customer ratings are categorized into Good, Average, and Poor, giving a quick view of overall customer satisfaction.

Insight: Most customers fall under the 'Good' category, indicating positive product experience.

Transactions by Payment Method (Pie)

This shows payment preferences, such as UPI, Credit Card, Debit Card, and Cash.

Insight: Digital payments dominate, with UPI and cards contributing the majority of transactions.

Total Sales by Mobile Model (Stacked Bar)

This visual compares sales performance across mobile models, helping identify best-selling products.

Insight: Certain flagship models clearly outperform others.

Total Sales by Day Name (Area Chart)

This chart highlights weekday-wise sales performance, useful for understanding customer buying behaviour.

Insight: Sales are higher on weekdays compared to weekends.

Brand Summary Table

This table provides a brand-wise summary of total sales and transactions, allowing quick comparison between brands.

Insight: Apple and Samsung lead in revenue, while other brands compete on volume.

◆ PAGE 2: MTD REPORT (Month-to-Date Analysis)

This page focuses on Month-to-Date (MTD) performance, helping track how the current month is progressing day by day.

◆ KPIs (Filtered to MTD)

- Total Sales – 262M
- Total Quantity – 6K
- Transactions – 1K
- Average Price – 41K

All KPIs dynamically update based on the selected month and year.

MTD by Day (Area Chart)

This chart shows cumulative sales growth day by day, which is critical for monitoring real-time performance.

Insight: Sales steadily increase through the month, indicating consistent demand.

This uses DAX time intelligence with a custom calendar table.

◇ PAGE 3: SAME PERIOD LAST YEAR (YoY Comparison)

This page compares current sales performance with the same period last year, removing seasonality bias.

◇ Table: Year, Quarter, Sales vs SPLY

This table directly compares Total Sales with Same Period Last Year, enabling quick YoY evaluation.

Insight: Current sales are higher than last year, indicating positive growth.

◇ Bar Charts (Year / Quarter / Month)

These visuals show side-by-side comparisons between current sales and last year's performance across different time levels.

Insight: Growth is consistent across year, quarter, and month levels.

DAX Used in Mobile Sale Dashboard Project

◇ 1. Total Sales

Total_Sales =

```
SUMX(  
    Sales_Data,  
    Sales_Data[Units Sold] * Sales_Data[Price per Unit]  
)
```

This measure calculates revenue at transaction level by multiplying quantity and price.

◇ 2. Total Quantity

Total_Quantity = SUM(Sales_Data[Units Sold])

◇ 3. Transactions Count

Transactions = DISTINCTCOUNT(Sales_Data[Transaction ID])

DISTINCTCOUNT Because transaction IDs are unique.

◇ 4. Average Price

Average_Price =

DIVIDE([Total_Sales], [Transactions])

DIVIDE -> It safely handles divide-by-zero errors.

◇ 5. MTD (Month-to-Date)

MTD Sales =

```
TOTALMTD(  
    [Total_Sales],  
    Customer_Calendar[Date]  
)
```

#This calculates cumulative sales from the start of the month to the selected date.

6. Same Period Last Year (SPLY)

Sales SPLY =

```
CALCULATE(  
    [Total_Sales],  
    SAMEPERIODLASTYEAR(Customer_Calendar[Date])  
)
```

This allows accurate year-over-year comparison by keeping seasonality constant.

7. Top 5 Cities (Calculated Table)

Top5CitiesBasedOnTotalSales =

```
TOPN(  
    5,  
    SUMMARIZE(  
        Sales_Data,  
        Sales_Data[City],  
        "TotalSales", [Total_Sales]  
    ),  
    [TotalSales],  
    DESC  
)
```

This dynamically identifies the top 5 revenue-generating cities.

❖ Why this project

“Mobile sales data is highly transactional and multi-dimensional, which makes it ideal for demonstrating **real-world analytics, time intelligence, and business insights.**”

❖ Conclusin

This dashboard helps decision-makers track **performance, growth, customer behavior, and regional trends** in one place.
